Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

mailroom@bskb.com

Office Action Summary

Application No.

10/784,957

Applicant(s)

YOO ET AL.

Examiner

GERALD SMARTH

Art Unit

2446

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 24 May 2010.
2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1, 4-8, 13-17, 20-24, 29-32, 39 and 40 is/are pending in the application.
4a) Of the above claim(s) _____ is/are withdrawn from consideration.
5) ☐ Claim(s) _____ is/are allowed.
6) ☒ Claim(s) 1, 4-8, 13-17, 20-24, 29-32, 39 and 40 is/are rejected.
7) ☐ Claim(s) _____ is/are objected to.
8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
10) ☒ The drawing(s) filed on 25 February 2004 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-544)
3) ☐ Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date _____
4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
5) ☐ Notice of Informal Patent Application
6) ☐ Other: _____

DETAILED ACTION

1. It is hereby acknowledged that 10/784957 the following papers have been received and placed of record in the file: Amendment date 05/24/10.

2. Claims 1, 4-8, 13-17, 20-24, 29-32, and 39-40 are presented for examination.

Claims 1 & 17 are independent claims. Claims 1 & 17 are being amended.

Response to Arguments

3. Applicant's arguments with respect to claims 1, 4-8, 13-17, 20-24, 29-32, and 39-40 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claims 1, 4-8, 13-17, 20-24, 29-32, and 39-40 are rejected under 35 U.S.C. 103(a) as being unpatentable over Choi (2003/02369005) in view of Sato (5884004) and in further view of Omoigui (7237254),

Regarding claim 1, Choi teaches a method of reproducing, by a content reproducing device, content information stored on a recording medium the method comprising: reproducing a first stream of data read out from the recording medium in synchronization with a second stream of data received from a Content providing server over a network;**(Choi discloses if the streaming is interrupted, the server software and the client software exchange messages to re-map a state of the client and re-synchronize playback of the content; Paragraph [005])**based on a first command sent from the content reproducing device to the content providing server, **(Choi discloses the method further includes receiving, by the client, the streamed media content from the server. The method includes sending a reconnect request from the client to the server if the streaming is interrupted; see paragraph 8 lines 7-13) sensing a failure in receiving the second stream of data; (Choi discloses the server component and the client component include computer-executable instructions for exchanging one or more messages to re-map the state of the client and to re-synchronize playback of the content if the streaming is interrupted; Paragraph [11])** upon sensing the failure, re-synchronizing the first stream of data stream of with the second data based on information for synchronization or re- synchronization included in the second stream of data, **(Choi discloses If the**

streaming is interrupted, the server software and the client software exchange messages to re-map a state of the client and re-synchronize playback of the content; Paragraph [005])

Choi does not explicitly disclose the first stream of data comprising audio/video data and the second data comprising content data associated with the first stream of data;

However Sato does teaches the first stream of data comprising audio/video data and the second data comprising content data associated with the first stream of data;
(Sato discloses the encoding system controller 200 also generates the reproduction time information IT defining the reproduction time of the title editing unit (video object, VOB), and the stream encoding data St33 defining the system encode parameters for multiplexing the encoded multimedia stream containing video, audio, and sub-picture data. Note that the reproduction time information IT and stream encoding data St33 are generated for the video object VOB of each title in one video zone VZ; Column 9 lines 7-15)

It would be obvious to a person of ordinary skill in the art at the time of the invention to modify the teachings of Choi's system for automatically recovering from failed network connections in streaming media scenarios with Sato's optical disc for generating a bistream containing a plurality of video objects including video and audio data. One of ordinary skill in the art would have been motivated to make this modification in order to have a more efficient and seamless reproduction method/system. *See Saito Column 2 lines 65 -Column 3 line 7.*

Choi nor Sato discloses explicitly thereby simultaneously and synchronously reproducing the first stream of data together with the second stream of data, the information including data rate information of the second stream of data and/or size information of the second stream of data.

However Omoigui does teach thereby simultaneously and synchronously reproducing the first stream of data together with the second stream of data, the information including data rate information of the second stream of data and/or size information of the second stream of data. **(Omoigui discloses the individual media streams have their own timelines, which are synchronized with each other so that the media streams can be rendered simultaneously for a coordinated multimedia presentation. The individual timelines define the timeline of the composite stream; see Column 6 lines 4-9, for data rate also see Column 12 lines 37-42)**

It would be obvious to a person of ordinary skill in the art at the time of the invention to modify the teachings of Choi and Saito to include Omoigui's seamless switching between different playback speeds of time-scale modified data streams. One of ordinary skill in the art at the time of the invention would have been motivated to make this modification in order to have a streaming system which allows for a more efficient way to alter speeds of streams. See Omoigui column 1 lines 62- column 2 lines 10.

Regarding claim 4, the modified Choi taught the method according to claim 1, as described above. Choi further teaches wherein the information is contained within a header of the second stream of data. **(Choi discloses when the distribution connection recovers, the server software 11 sends another stream header before streaming the content; Page 7 paragraph 93 lines 6-8)**

Regarding claim 5, the modified Choi taught the method according to claim 1, as described above. Choi further teaches wherein the sensing step includes sensing whether the failure in receiving the second data is due to a disconnection or a delay of transmission of the second stream of data over the network. **(Choi discloses the method further includes receiving, by the client, the streamed media content from the server. The method includes sending a reconnect request from the client to the server if the streaming is interrupted; Page 2 paragraph 8 lines 7-13)**

Regarding claim 6, the modified Choi taught the method according to claim 1, as described above. Omoigui also teaches further comprising: delaying a time for re-synchronization, wherein during the re-synchronization delay the first stream of data is reproduced, and the second stream of data is muted and not reproduced. **(Omoigui discloses thus, client 104 is able to render the streams at the new playback speed with very little (if any) noticeable delay and little or no noticeable break or pause between the user's submission of the new playback**

speed and the actual rendering at the new playback speed; Column 12 lines 51-55)

Regarding claim 7, the modified Choi taught the method according to claim 1, as described above. Omoigui also teaches further comprising: delaying a time, for re-synchronization, wherein during the re-synchronization delay the first stream of data is reproduced, and an interpolated second stream of data is reproduced. **(Omoigui discloses the invention switches between these different playback speeds in a seamless manner, advantageously reducing breaks and/or delays between the time the user selects the new playback speed and the time the multimedia content begins being played back at the new speed; Column 15 lines 35-40)**

Regarding claim 8, the modified Choi taught the method according to claim 1, as described above. Omoigui also teaches further comprising: delaying a time for re-synchronization, wherein during the re-synchronization delay the first stream of data is reproduced, and a previous segment of the second stream of data is reproduced. **(Omoigui discloses the invention switches between these different playback speeds in a seamless manner, advantageously reducing breaks and/or delays between the time the user selects the new playback speed and the time the multimedia content begins being played back at the new speed; Column 15 lines 35-40)**

Regarding claim 13, the modified Choi taught the method according to claim 1, as described above. Sato further teaches wherein said re-synchronization step includes: calculating an offset value for the second stream of data to establish re-synchronization; sending a second command requesting transmission of the second stream of data corresponding to the calculated offset value from the content producing device to the content providing server ; ***(Sato discloses the audio start gap A.sub.-- STGAP is the time offset between the start of the audio and video presentation at the beginning of a VOB. This is a useful parameter for declaring seamless reproduction with the preceding encoded system stream; Column 61 line 27-30)and*** re-synchronizing the second stream of data transmitted in response to the second command with the first stream of data read out from the recording medium. ***(Omoigui discloses in embodiments where server 102 includes an intelligent data transfer mechanism to detect the rate at which client 104 is accepting data, client 104 and server 102 eventually resynchronize (step 310).; Column 12 lines 51-55)***

Regarding claim 14, the modified Choi taught the method according to claim 13, as described above. Sato further teaches wherein said calculating step is based on a present playing time of the first stream of data and a number of bytes per second of the second stream of data. ***(Sato discloses though comprising two recording surfaces similarly to the recording media shown in FIG. 7, the DVD recording medium RC3 shown in FIG. 8 has the recording surfaces on opposite sides of the disk, i.e., has***

the first data recording surface RS1 on side SA and the second data recording surface RS2 on side SB; Column 14 line 60-65)

Regarding claim 15, the modified Choi taught the method according to claim 14, as described above. Sato further teaches wherein the offset value of the second data capable of re-synchronization is calculated by adding the present playing time of the first stream of data to a predetermined amount of time to produce a result and multiplying the result by the number of bytes per second of the second stream of data. ***(Sato also discloses when the reproducing apparatus of the digital video disk system is configured with a disk read rate of 11 Mbps, a maximum AV data compression rate of 10 Mbps, and a track buffer (stream buffer 2400) capacity of 4 Mbits, for example, a data underflow state will occur; Column 37 line 6-10)***

Regarding claim 16, the modified Choi taught the method according to claim 15, as described above. Sato further teaches wherein the predetermined amount of time is proportional to a speed of the second stream of data being transferred over the network. ***(Sato discloses in order to achieve the aforementioned objective, an interleaving method which for the presentation of a bitstream that is reproduced by selecting two or more data units from a bitstream comprising three or more data units contiguous on the same time-base is characterized by generating said bitstream by arranging the selected data units in a particular sequence on the same time-base based on the presentation time of each data unit***

so that it is possible to sequentially access all data units and present only the selected data units without time-base intermittence; Column 3 line 18-27)

Regarding claim 17, Chen teaches an apparatus for reproducing content information comprising: a renderer configured to reproduce a first stream of data read out from a recording medium in synchronization with a second stream of data received from a content providing server(Choi discloses if the streaming is interrupted, the server software and the client software exchange messages to re-map a state of the client and re-synchronize playback of the content; Paragraph [005]) over a network based on a first command, (Choi discloses the method further includes receiving, by the client, the streamed media content from the server. The method includes sending a reconnect request from the client to the server if the streaming is interrupted; Page 2 paragraph 8 lines 7-13) and a processor configured to sense a failure in receiving the second stream of data (Choi discloses the server component and the client component include computer-executable instructions for exchanging one or more messages to re-map the state of the client and to re-synchronize playback of the content if the streaming is interrupted; Paragraph [11]) and upon sensing the failure in, re-synchronize the first stream of data with the second stream of data based on information for synchronization or re-synchronization including in the second stream of data, (Choi discloses If the streaming is interrupted, the server software and the client software exchange messages to re-map a state of the client and re-synchronize playback of the

content; Paragraph [005])

Choi does not explicitly disclose the first stream of data comprising audio/video data and the second data comprising content data associated with the first stream of data;

However Sato does teaches the first stream of data comprising audio/video data and the second data comprising content data associated with the first stream of data;
(Sato discloses the encoding system controller 200 also generates the reproduction time information IT defining the reproduction time of the title editing unit (video object, VOB), and the stream encoding data St33 defining the system encode parameters for multiplexing the encoded multimedia stream containing video, audio, and sub-picture data. Note that the reproduction time information IT and stream encoding data St33 are generated for the video object VOB of each title in one video zone VZ; Column 9 lines 7-15)

It would be obvious to a person of ordinary skill in the art at the time of the invention to modify the teachings of Choi's system for automatically recovering from failed network connections in streaming media scenarios with Sato's optical disc for generating a bistream containing a plurality of video objects including video and audio data. One of ordinary skill in the art would have been motivated to make this modification in order to have a more efficient and seamless reproduction method/system. *See Saito Column 2 lines 65 -Column 3 line 7.*

Choi nor Sato discloses explicitly thereby simultaneously and synchronously reproducing the first stream of data together with the second stream of data, the

information including data rate information of the second stream of data and/or size information of the second stream of data.

However Omoigui does teach thereby simultaneously and synchronously reproducing the first stream of data together with the second stream of data, the information including data rate information of the second stream of data and/or size information of the second stream of data. **(Omoigui discloses the individual media streams have their own timelines, which are synchronized with each other so that the media streams can be rendered simultaneously for a coordinated multimedia presentation. The individual timelines define the timeline of the composite stream; see Column 6 lines 4-9, for data rate also see Column 12 lines 37-42)**

It would be obvious to a person of ordinary skill in the art at the time of the invention to modify the teachings of Choi and Saito to include Omoigui's seamless switching between different playback speeds of time-scale modified data streams. One of ordinary skill in the art at the time of the invention would have been motivated to make this modification in order to have a streaming system which allows for a more efficient way to alter speeds of streams. See Omoigui column 1 lines 62- column 2 lines 10.

Regarding claim 20, the modified Choi taught the apparatus according to claim 17, as described above. Choi further teaches wherein the information is contained within a header of the second stream of data. **(Choi discloses when the distribution**

connection recovers, the server software 11sends another stream header before streaming the content; Page 7 paragraph 93 lines 6-8)

Regarding claim 21, the modified Choi taught, the apparatus according to claim 17, as described above. Choi also teaches wherein the processor is configured to determine whether the failure is due to a disconnection or a delay of transmission of the second stream of data over the network. **(Choi discloses the method further includes receiving, by the client, the streamed media content from the server. The method includes sending a reconnect request from the client to the server if the streaming is interrupted; Page 2 paragraph 8 lines 7-13)**

Regarding claim 22, the modified Choi taught the apparatus according to claim 17, as described above. Omoigui further teaches wherein the processor is configured to delay a time for re-synchronization, and control such that during the re- synchronization delay the first stream of data is reproduced, and the second stream of data is muted and not reproduced, during the re-synchronization delay. **(Omoigui discloses thus, client 104 is able to render the streams at the new playback speed with very little (if any) noticeable delay and little or no noticeable break or pause between the user's submission of the new playback speed and the actual rendering at the new playback speed; Column 12 lines 51-55)**

Regarding claim 23, the modified Choi taught the apparatus according to claim 17, as

described above. Omoigui further teaches wherein the processor is configured to delay a time for resynchronization, and control such that during the resynchronization delay the first stream of data is reproduced, and an interpolated second stream of data is reproduced, during the re-synchronization delay. **(Omoigui discloses the invention switches between these different playback speeds in a seamless manner, advantageously reducing breaks and/or delays between the time the user selects the new playback speed and the time the multimedia content begins being played back at the new speed; Column 15 lines 35-40)**

Regarding claim 24, the modified Choi taught the apparatus according to claim 17, as described above. Omoigui further teaches wherein the processor is configured to delay a time for resynchronization, and control such that during resynchronization delay-the first data is reproduced, and a previous segment of the second stream of data is reproduced, during the re-synchronization delay. **(Omoigui discloses in embodiments where server 102 includes an intelligent data transfer mechanism to detect the rate at which client 104 is accepting data, client 104 and server 102 eventually resynchronize (step 310).; Column 12 lines 51-55)**

Regarding claim 29, Chen, Sato, Choi in view of Lear taught the apparatus according to claim 17, as described above. Sato further teaches wherein said processor, is configured to re-synchronize the first stream of data and second stream of

data, calculating an offset value for the second stream of data to establish re-synchronization sending a second data corresponding to the calculated offset value to the Content providing server; ***(Sato discloses the audio start gap A.sub.-- STGAP is the time offset between the start of the audio and video presentation at the beginning of a VOB. This is a useful parameter for declaring seamless reproduction with the preceding encoded system stream; Column 61 line 27-30)*** and re-synchronizing the second stream of data transmitted in response to the second command with the first stream of data read out from the recording medium. . ***(Lear discloses thus, multiple simultaneous events may be streamed concurrently on separate channels, or channels may be used to transmit delayed copies of the same content allowing channel selection as a form of dynamic fast forward and rewind; Paragraph 76)***

Regarding claim 30, Chen, Sato, Choi in view of Lear taught the apparatus according to claim 29, as described above. Sato further teaches wherein said processor is configured to use a present playing time of the first stream of data and a number of bytes per second stream of the second data, when calculating the offset value, ***(Sato discloses the audio start gap A.sub.-- STGAP is the time offset between the start of the audio and video presentation at the beginning of a VOB. This is a useful parameter for declaring seamless reproduction with the preceding encoded system stream; Column 61 line 27-30)***

Regarding claim 31, the modified Choi taught the apparatus according to claim 30, as described above. Sato further teaches wherein the offset value is calculated by said pr the modified Choi of the first stream of data to a predetermined amount of time to produce a result and multiplying the result by the number of bytes per second of the second stream of data. ***(Sato also discloses when the reproducing apparatus of the digital video disk system is configured with a disk read rate of 11 Mbps, a maximum AV data compression rate of 10 Mbps, and a track buffer (stream buffer 2400) capacity of 4 Mbits, for example, a data underflow state will occur; Column 37 line 6-10)***

Regarding claim 32, the modified Choi taught the apparatus according to claim 31, as described above. Sato further teaches wherein the predetermined amount of time is proportional to a speed of the second stream of data being transferred over the network. ***(Sato discloses in order to achieve the aforementioned objective, an interleaving method which for the presentation of a bitstream that is reproduced by selecting two or more data units from a bitstream comprising three or more data units contiguous on the same time-base is characterized by generating said bitstream by arranging the selected data units in a particular sequence on the same time-base based on the presentation time of each data unit so that it is possible to sequentially access all data units and present only the selected data units without time-base intermittence; Column 3 line 18-27)***

Regarding claim 39, the modified Choi taught the method according to claim 1, as described above. Choi further teaches wherein the step of reproducing comprises: buffering the second stream of data prior to synchronization. **(Choi discloses if the reconnection process occurred relatively quickly, the server 108 may have buffered a small amount of the live content, and will deliver that buffered content to the client 110 if reconnection is successful; Page 3 paragraph 28 lines 10-14)** *(Gould discloses packets received from the secondary stream are buffered in buffer 20 (as more fully explained below). The failover device 16 can distinguish the source of the packets because the IP header information in each packet contains unique RMPP; Paragraph 28 lines 2-5)*

Regarding claim 40, the modified Choi taught the apparatus according to claim 17, as describe above. Sato further teaches comprising: a buffer configured to buffer the second stream of data prior to synchronization. **(Sato also discloses when the reproducing apparatus of the digital video disk system is configured with a disk read rate of 11 Mbps, a maximum AV data compression rate of 10 Mbps, and a track buffer (stream buffer 2400) capacity of 4 Mbits, for example, a data underflow state will occur; Column 37 line 6-10)**

Conclusion

6. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Gerald Smarth whose telephone number is (571)270-1923. The examiner can normally be reached on Monday-Friday(7:30am-5:00pm)est.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jeff Pwu can be reached on (571)272-6798. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
